Researchers point out holes in McAfee's Web site

McAfee says it is working to fix three holes researchers found in its Web site.

by **Elinor Mills**  @elinormills / March 28, 2011 7:28 PM PDT

Cross Site Scripting in download.mcafee.com. "In a worst case scenario this vulnerability could allow attacks that spoof the McAfee brand by presenting a URL that looks like it directs to a McAfee Web site but in fact directs elsewhere."

Researcher finds serious Android Market bug

Google applies technical fix to bug, but Jon Oberheide says Android Market should be alerting phone owners when an app is being remotely downloaded via the Web site.

Oberheide described the XSS vulnerability as "low-hanging fruit" and said he was surprised no one had discovered it before. Such bugs are very common in Web sites.
